10. Classes I

- 13. Standard C++ Classes
- 14. Custom Objects

Kyung Hee University

Data Analysis & Vision Intelligence

195

String Objects (1)

```
#include <string>
using namespace std;
using std::string;

string name = "joe";
std::cout << name << '\n';
name = "jane";
std::cout << name << '\n';

string name1 = "joe", name2;
name2 = name1;
std::cout << name1 << " " << name2 << '\n';</pre>
```

String Objects (2)

word

string word = "Good-bye";

.e. .o. .o. .q. .-. .p. .h. .e.

.o. .q. .-. .p. .h.

other

string other = word.substr(2, 5);

- operator[]
 - provides access to the value stored at a given index within the string
- operator=
 - assigns one string to another
- operator+=
 - appends a string or single character to the end of a string object
- at
- provides bounds-checking access to the character stored at a given index
- length
 - · returns the number of characters that make up the string
- size
 - returns the number of characters that make up the string (same as length)
- find
 - · locates the index of a substring within a string object
- substr
 - · returns a new string object made of a substring of an existing string object
- empty
 - returns true if the string contains no characters; returns false if the string contains one or more characters
- clear
 - · removes all the characters from a string

Kyung Hee University

Data Analysis & Vision Intelligence

197

String Objects (3)

```
std::string word;
word = "good";
word.operator=("good");
word += "-bye";
word.operator+=("-bye");
```

Input/Output Streams (1)

```
std::cin >> x;
std::cout << x;
cin.operator>>(x);
cout.operator<<(x);
cout.operator<<(('\n');</pre>
```

Kyung Hee University

Data Analysis & Vision Intelligence

199

Input/Output Streams (2)

Input/Output Streams (3)

```
#include <iostream>
#include <string>
int main() {
    std::string line;
    std::cout << "Please enter a line of text: ";
    std::cin >> line;
    std::cout << "You entered: \"" << line << "\"" << '\n';
}

#include <iostream>
#include <string>
int main() {
    std::string line;
    std::cout << "Please enter a line of text: ";
    getline(std::cin, line);
    std::cout << "You entered: \"" << line << "\"" << '\n';
}</pre>
```

Kyung Hee University

Data Analysis & Vision Intelligence

201

File Streams (1)

```
#include <iostream>
#include <fstream>
#include <string>
#include <vector>
void print_vector(const std::vector<int>& vec) {
    std::cout << "{";
    int len = vec.size();
    if (len > 0) {
        for (int i = 0; i < len - 1; i++)
            std::cout << vec[i] << ",";
        std::cout << vec[len - 1];
    }
    std::cout << "}\n";
}</pre>
```

File Streams (2)

```
void save_vector(const std::string& filename, const std::vector<int>& vec)
{
    std::ofstream out(filename);
    if (out.good()) {
        int n = vec.size();
        for (int i = 0; i < n; i++)
            out << vec[i] << " "; // Space delimited
        out << '\n';
    }
    else std::cout << "Unable to save the file\n";
}
void load_vector(const std::string& filename, std::vector<int>& vec) {
    std::ifstream in(filename);
    if (in.good()) {
        vec.clear();
        int value;
        while (in >> value) vec.push_back(value);
    }
    else std::cout << "Unable to load in the file\n";
}</pre>
```

Kyung Hee University

Data Analysis & Vision Intelligence

203

File Streams (3)

```
int main() {
   std::vector<int> list;
  bool done = false;
  char command;
  while (!done) {
      std::cout << "I)nsert <item> P)rint "
         << "S)ave <filename> L)oad <filename> "
         << "E)rase Q)uit: ";
      std::cin >> command;
      int value;
      std::string filename;
      switch (command) {
         case 'I':
         case 'i':
            std::cin >> value;
            list.push_back(value);
            break;
```

File Streams (4)

```
case 'P':
      case 'p':
       print_vector(list);
                                        break;
     case 'S':
      case 's':
        std::cin >> filename;
                               save_vector(filename, list);
        break;
      case 'L':
      case 'l':
        std::cin >> filename;
                                        load_vector(filename, list);
        break;
     case 'E':
      case 'e':
        list.clear();
                                       break;
      case 'Q':
     case 'q':
        done = true;
                                       break;
   }
}
```

File Streams (5)

Complex Numbers (1)

```
std::complex<float> fc;
std::complex<double> dc;
std::complex<long double> ldc;

// operator= : assigns the contents
// real : accesses the real part of the complex number
// imag : accesses the imaginary part of the complex number
// operator+=
// operator-=
// operator/=
// non-member functions
// abs, arg, norm, conj, ...
```

Kyung Hee University

Data Analysis & Vision Intelligence

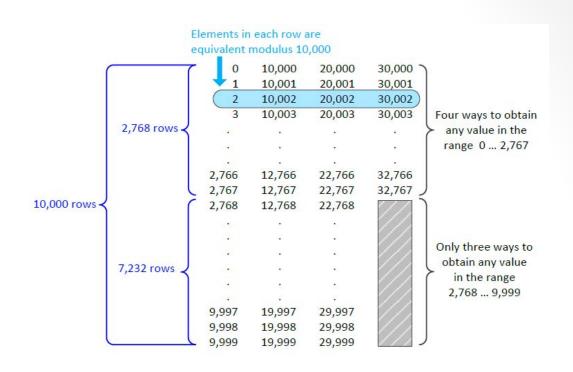

207

Complex Numbers (2)

```
#include <iostream>
#include <complex>
int main() {
    std::complex<double> c1(2.0, 3.0), c2(2.0, -3.0);
    double real1 = c1.real(),
        imag1 = c1.imag(),
        real2 = c2.real(),
        imag2 = c2.imag();
    std::cout << c1 << " * " << c2 << " = "
        << real1*real2 - imag1*imag2 << " , "
        << imag1*real2 + real1*imag2
        << '\n';
    std::cout << c1 << " * " << c2 << " = " << c1*c2 << '\n';
}

// http://www.cplusplus.com/reference/complex/</pre>

    }
    for (int i = 0; i < 100; i++)
        std::cout << i << ": " << histogram[i] << std::endl;
}</pre>
```

Object Basics

- In computer science, an object can be a variable, a data structure, a function, or a method, and as such, is a value in memory referenced by an identifier.
- In the object-oriented programming paradigm, object can be a combination of variables, functions, and data structures; in particular in class-based variations of the paradigm it refers to a particular instance of a class.
- An object is an instance of a class. The terms object and instance may be used interchangeably.

Data Analysis & Vision Intelligence

213

Instance Variables (1)

```
class className {
public: // access specifier
    type memberName; // member
};

class Point {
public:
    double x;
    double y;
};

Point p1; // instance, object
p1.x = 10; // dot member selection operator(.)
p1.y = 20;
```

Instance Variables (2)

```
#include <iostream>
class Point {
public:
  double x; // The point's x coordinate
  double y; // The point's y coordinate
};
int main() {
  Point pt1, pt2;
  pt1.x = 8.5;
                    pt1.y = 0.0;
  pt2.x = -4;
                       pt2.y = 2.5;
  std::cout << "pt1 = (" << pt1.x << "," << pt1.y << ")\n";
  std::cout << "pt2 = (" << pt2.x << "," << pt2.y << ")\n";
  pt1 = pt2;
  std::cout << "pt1 = (" << pt1.x << "," << pt1.y << ")\n";
  std::cout << "pt2 = (" << pt2.x << "," << pt2.y << ")\n";
  pt1.x = 0;
  std::cout << "pt1 = (" << pt1.x << "," << pt1.y << ")\n";
  std::cout << "pt2 = (" << pt2.x << "," << pt2.y << ")\n";
```

Kyung Hee University

Data Analysis & Vision Intelligence

215

Instance Variables (3)

```
#include <iostream>
#include <string>
#include <vector>
class Account {
public:
  std::string name;
  int id:
  double balance;
};
void add_account(std::vector<Account>& accts) {
  std::string name; int number;
  double amount:
  std::cout << "Enter name, account number, and account balance: ";
  std::cin >> name >> number >> amount;
  Account acct;
  acct.name = name; acct.id = number;
  acct.balance = amount;
  accts.push_back(acct);
```

Instance Variables (4)

```
void print_accounts(const std::vector<Account>& accts) {
   int n = accts.size();
  for (int i = 0; i < n; i++)
      std::cout << accts[i].name << "," << accts[i].id</pre>
         << "," << accts[i].balance << '\n';
int main() {
  std::vector<Account> customers;
  add_account(customers);
  add_account(customers);
  print_accounts(customers);
//void swap(Account& er1, Account& er2) {
    Account temp = er1;
11
   er1 = er2;
     er2 = temp;
//}
```

Kyung Hee University

Data Analysis & Vision Intelligence

217

Member Functions (1)

```
// public: directly referenced outside of the class
// private: can be accessed only by functions within the class,
// default

std::vector<Account> accountDB;
bool withdraw(Account& acct, double amt) {...}
...
withdraw(accountDB[i], 10000.));
```

Member Functions (2)

```
class Account {
  string name;
  int id;
  double balance;
public:
  void deposit(double amt) {
     balance += amt;
  bool withdraw(double amt) {
     bool result = false;
     if (balance - amt >= 0) {
        balance -= amt;
        result = true;
                                            Account acct;
     return result;
                                            acct.withdraw(100.);
};
```

Kyung Hee University

Data Analysis & Vision Intelligence

219

Member Functions (3)

Constructors (1)

```
// Constructors are called when an instance of a class is created.
// A constructor has the same name as the class.
// A constructor has no return type (not even void).
#include <iostream>
#include <iomanip>
#include <string>
class Account {
  std::string name;
                                 int id;
  double balance;
public:
  Account(const std::string& customer_name, int account_number,
  double amount): name(customer_name), id(account_number),
     balance(amount)
      if (amount < 0) {</pre>
         std::cout << "Warning: negative account balance\n";</pre>
        balance = 0.0;
   }
```

Kyung Hee University

Data Analysis & Vision Intelligence

221

Constructors (2)

Constructors (3)

```
int main() {
  Account acct1("Joe", 2312, 1000.00);
  Account acct2("Moe", 2313, 500.29);
  acct1.display();
                      acct2.display();
  std::cout << "----" << '\n';
  acct1.withdraw(800.00);
  acct2.deposit(22.00);
  acct1.display();
                              acct2.display();
// constructor initialization list ":" , reference or const member
// A class must have at least one constructor, either defined by the
// program or by the compiler.
// The default constructor is called whenever an object is created
// without passing any arguments.
// If you define any type of constructor, you must also define a
// default constructor if it is needed.
```

Kyung Hee University

Data Analysis & Vision Intelligence

223

Defining a New Numeric Type (1)

```
#include <iostream>
#include <cstdlib>
class SimpleRational {
   int numerator;
   int denominator;
public:
   SimpleRational(int n, int d): numerator(n), denominator(d) {
    if (d == 0) {
       std::cout << "Zero denominator error\n";
       exit(1);
    }
}
SimpleRational(): numerator(0), denominator(1) {}
void set_numerator(int n) {
    numerator = n;
}</pre>
```

Defining a New Numeric Type (2)

```
void set_denominator(int d) {
    if (d != 0) denominator = d;
    else {
        std::cout << "Zero denominator error\n";
        exit(1);
    }
} int get_numerator() { return numerator; }
    int get_denominator() { return denominator; }
};
SimpleRational multiply(SimpleRational f1, SimpleRational f2) {
    return {f1.get_numerator() * f2.get_numerator(),
        f1.get_denominator() * f2.get_denominator()};
}
void print_fraction(SimpleRational f) {
    std::cout << f.get_numerator() << "/" << f.get_denominator();
}</pre>
```

Kyung Hee University

Data Analysis & Vision Intelligence

225

Defining a New Numeric Type (3)

```
int main() {
  SimpleRational fract(1, 2); // The fraction 1/2
   std::cout << "The fraction is ";</pre>
  print_fraction(fract);
  std::cout << '\n';
  fract.set_numerator(19);
  fract.set denominator(4);
   std::cout << "The fraction now is "; print_fraction(fract);</pre>
   std::cout << '\n';
  SimpleRational fract1{1, 2}, fract2{2, 3};
  auto prod = multiply(fract1, fract2);
   std::cout << "The product of "; print_fraction(fract1);</pre>
   std::cout << " and ";
                                     print_fraction(fract2);
   std::cout << " is ";
                                     print_fraction(prod);
  std::cout << '\n';
```

Encapsulation

- The class interface—the visible part.
 - Clients see and can use the public parts of an object.
 - The public methods and public variables of a class constitute the interface of the class.
 - A class's interface specifies what it does.
- The class implementation—the hidden part.
 - Clients cannot see any private methods or private variables. Since this private information is invisible to clients, class developers are free to do whatever they want with the private parts of the class.
 - A class's implementation specifies how it accomplishes what it needs to do.
